1. **Photoshop Customization:** • File Type \* BMP file type (Photoshop doesn't need to have a `_.bmp_` extension) \* JPEG file type \* TIFF file type \* GIF file type \* PNG file type (Photoshop doesn't need to have a `_.png_` extension) 2. **Background:** • The Background is a flat color. Even though the Background can show transparency, Photoshop doesn't support it and can only be placed onto a document from the top down, not the bottom up. • You can set a Background color by choosing "custom" (if you want to use your monitor's default color) or "background" from the drop-down list in the top right corner (see Figure 3-3). Background transparency is not supported in Photoshop. • The Background color is set on the image's layer, not on the actual background of the document. • The Background color is set on the image's layer and cannot be moved or erased. • The Background color is not visible unless the "background" option in the Layers panel is checked. • The Background color cannot be changed except in the Layers panel. **Figure 3-3:** Set the Background color with the drop-down menu and then use the transparency tool to view it. 3. **Presets:** • `_Preset editing_` is a key ability of Photoshop that allows Photoshop to adapt quickly to the type of images that you create. Photoshop lets you save the settings of various tool presets and states so that the tools apply them automatically. Photoshop then applies the settings automatically depending on the current task you are doing. For example, if you are making a digital painting, you might want the color picker to work the same as the paintbrush. • Presets come in two types: standard and custom. Standard are predefined presets that enable Photoshop to automatically perform certain functions on an image. Custom presets are ones you create. Standard presets are available from the File menu; you see several predefined presets (like letters and shapes) on this menu (see Figure 3-4). There are many predefined tools, so choose the tool you want to use. To create a custom preset, begin by naming it. **Figure 3-4:** Custom presets are

Q: Can I use Javascript to find the number of nulls in an object? In Javascript, can I find out the number of nulls in an object using script? A: There is no direct way to do this. However, you could use the following trick, `var arr = [null, null, null, null, null, null, null]; console.log(arr.length) // => 6` and `var arr = {a: null, b: null, c: null, d: null, e: null, f: null}; console.log(arr.length) // => 6`

Q: How to solve this  $P(A \cup B \cup C) + P(B \cap C) + P(C \cap A) = P(A) + P(B) + P(C)$ ? An urn contains 4 red balls, 5 black balls and 6 yellow balls. Now 3 balls are drawn out uniformly at random without replacement. What is  $P(A \cup B \cup C) + P(B \cap C) + P(C \cap A)$  where A, B, C are the red, black and yellow balls? A: Well, using the formula given in comments:  $P(A \cup B \cup C) + P(B \cap C) + P(C \cap A) = P(A) + P(B) + P(C) + P(B \cap C) - P(B) - P(C) - P(A \cap C)$  because by inclusion exclusion  $P(B \cap C) = P(C \cap B)$  iff  $P(A \cap C) = P(C \cap A)$  and  $P(B) = P(B \cap C) + P(B \cap C^c)$

Enhancement of erythrocyte aggregation by acute erythrocyte osmotic fragility and its relation with hyperlipaemia in patients with type II hyperlipidemia. There is evidence that red blood cells (RBCs) undergo heterogeneous changes in response to hyperlipidemia and/or hyperosmolar stress. To study this we designed an experiment in which healthy subjects were subjected to acute osmotic stress induced by 250 mOsm (haematocrit 21%) for 15 min at 25 degrees C. Blood was drawn after 0, 15, 30, 45, 60 and 120 min to measure plasma osmolality, haematocrit, haemoglobin concentration, erythrocyte mean cell volume, osmotic fragility and aggregation (A1) (EID and TID). The relationship between A1 and hyperlipaemia was studied. Subjects included 11 patients with type IIa and 13 with type IIb hyperlipaemia. There was an increase in RBC aggregation at 15 min (p
