(1) Field of the Invention The present invention relates to an image output apparatus, an image output method, and a computer-readable storage medium. (2) Related Art Conventionally, when an image is to be output, an image output apparatus forms the image on paper and the like and outputs the image. Outputting a large number of sheets of paper is inefficient and raises issues such as the utilization ratio of paper being insufficient and having to be increased in order to reduce paper consumption, the operation of an image output apparatus being inefficient, and the like. In view of the above, there has been proposed a technique that reduces the number of sheets of paper by composing an image on paper or the like on a plurality of sheets and outputs the composite image. For example, Japanese Patent Application Laid-Open No. 2004-353750 discloses a page compositing apparatus that reduces the number of output sheets by compositing one page of a source document and multiple pages of a document to be associated with the page of the source document when a plurality of pages of the document to be associated with the page of the source document are formed into one page. However, according to the conventional technique, a document including a plurality of pages of the same source document cannot be processed. For example, a document containing a plurality of images (individual-image-based pages) cannot be processed and output on a single sheet. As described above, according to the conventional technique, when a plurality of pages of a source document are to be output as a single composite document, a plurality of pages of the same source document cannot be processed simultaneously or a plurality of pages of different source documents cannot be processed simultaneously.Every year, the Diversity Council of the IEEE brings together a diverse group of individuals to debate and discuss best practices in community building and inclusion in technology and engineering fields. In "White Men, Black Codes: The Technical Cultural Dilemma," a session proposed by student member and Resnick Sustainability Institute alum, Brandon Kopec, IEEE Diversity Council members will delve into the technical issues that plague the company that places a woman of color at a managerial or executive level, and the technical issues surrounding "light-skinned" black women. For the first time, the Diversity Council has created a mock case study and is inviting the public to critique the models that are being proposed as solutions. Asking fundamental questions about implicit bias, the consequences of racial coding of products,

Development of a large scale spotted microarray (SMD) as a rapid and efficient method to estimate HhaI endonuclease-specific DNA methylation profiles of human lymphoblastoid cell lines. A large scale spotted microarray is a promising tool for developing restriction digestion profiles and

simultaneous quantitative measurements of two or more methylation states at a given DNA sequence. We developed a large scale spotted microarray (SMD) for HhaI endonuclease-specific DNA methylation profiles of human lymphoblastoid cell lines (LCLs). This SMD allows an estimation of the percentage of methylated HhaI sites in the genome and the distribution of the methylation state of HhaI sites throughout the genome. Here we present a detailed protocol for making SMD, followed by instructions for high throughput and simultaneous quantitative measurements of methylation states at individual HhaI sites in the genome.Q: What are the pros and cons of a front-engine, rear-drive sedan with a supercharged engine? I am considering buying a used car that seems to be in good condition, but has two things not up to the quality of my other used car. One is that it is a front-engine, rear-drive, front-wheel drive vehicle. The other is that it has a supercharged engine. Do these two things jointly add up to a less reliable car than either one of them separately? (Or does it depend on whether the powertrain in question is a turbo or naturally-aspirated engine?) A: I would like to put it in a different way. If the engine has been supercharged and the transmission is manual, what are the benefits to the owner? When a car has been supercharged, the air in the intake (i.e. the amount of oxygen and fuel) is higher. This has a big advantage, since combustion of the fuel is faster. As a consequence, your car will run cleaner. Also, when the supercharger sucks in air, it sucks in more oxygen, more fuel, and hence more energy. Therefore, your engine will run cleaner and more efficiently. The turbocharger produces more boost (pressure) than is needed to suck air through the engine, but it is consuming more fuel to produce this extra pressure. Hence, on a per-stroke basis, the engine burns less fuel. Finally, when a turbocharged engine burns less fuel and the
